Karen AP7

243 In these days it is the usual practice to sell the grain to the
●442 traders directly from the threshing-floor. Sometimes it is stored for a few months in the hope of an advance in price, but most of the smaller cultivators are compelled by their poverty to sell at once. The buyers may be Burmans, but in these later years are more often Chinese. A few Karens have done some trading in paddy, although they are generally not so successful as the traders of the other nationalities.

343 The grain kept for family use is stored in bins of bamboo made in the shape of great baskets or "weh." These "weh" vary in size from those having double the diameter of a bushel-basket up to the huge ones of ten or twelve feet in diameter and of equal height. They are set upon platforms several feet above the ground and adjoining or close to the house. The planks forming the bottom are firmly secured together and coated with cow-dung. After a bin has been filled, the top is covered with a layer of straw, well packed in, and a thick coating of cow-dung is spread over it to seal the grain.

421 It is not my purpose in this work to enter into a detailed eco-
435 nomic study of Karen agriculture. Here I have but a few observations to offer. Under the conditions obtaining just before the World War, the economic outlook for the Karen cultivator was none too good. The Karen people are no more provident than the Burmese. At the beginning of the season they borrow money, for which they must pay one hundred baskets of paddy for fifty rupees of money.[7] If they have no oxen of buffaloes of their own they must hire them, paying from fifty to sixty rupees a yoke for the former and ten rupees additional each for the latter. To hire a man to work in the rainy season and to plow costs about the same as paying for the use of a team of oxen. If he is employed until the threshing is finished, he costs another fifty rupees. The yield per acre varies all the way from twenty-five to seventy baskets, according to the quality of the land and whether a little manure has been used or not. For many years the price of paddy remained close to one hundred rupees for one hundred baskets, being sometimes a little below and at others a few rupees above that price. Before the war competition and speculation had forced the price up gradually, until it reached a maximum of one hundred and thirty-five rupees.

[7] The size of baskets varies in different districts, ranging in capacity from forty to sixty pounds. Those having a capacity of forty-six pounds are now considered to be of standard size. As the price varies inversely with the size, the result is about the same.
